A Potential Employee's Look into Compuware

Dave Hill   TC362 2/19/13

After approaching the IT solutions company, Compuware, at a career fair at Michigan State they have been pursuing me as a potential employee for their company working as a guardian for their APM solutions. This has allowed me to get an extremely in depth insight to their company and learn about the technologies they use. Compuware has been alive for almost 40 years and is actively employed by huge companies such as Google, LG, and Amazon. In fact, 46 of the top 50 fortune 500 companies use them.

Application Performance Management (APM)

Compuware's APM software is a huge part of their business. This is where Compuware wants me to become an expert in since it is one of their most successful applications. This program helps customers achieve their end-user experience and APM goals faster. They combine deep product knowledge with extensive hands-on experience to help clients improve application performance and business results.

Business Portfolio Management

Compuware can take your business to the next level by automating your professional services. This gives clients unrivaled resource management capabilities, can standardize processes, and helps the business make better informed decisions. They offer these services globally and in multiple languages to support all users. Their services also help with making intuitive and flexible project plans with a single source of data for accurate analyses. Plus they offer their guardian services to their clients which are professionals who can actively provide solutions to issues they have either remotely, or in person. In all, this solution increases revenues, drives strong margins, ensures high customer satisfaction, increases market shares, and participates as a strategic member of the business.

Mainframe Solutions

If you have development resources that need to be reliable, secure, and efficient Compuware is the company for you. Compuware will save you money on resources by improving mainframe performance and increasing customer satisfaction. They have tools that can continuously monitor and record IT user application interactions. Plus they will create automated testing tools that incorporate their clients' requirements into their tests and thoroughly document these results. They also offer a variety of debugging tools that will optimize clients' mainframes and help them quickly move applications into production with confidence.

Uniface

If a company has strict timelines and critical needs for an application to be developed Uniface is the product to get. It is an online interface that allows a large community of developers from all over the world to program applications together in a quick and organized manner over the cloud. This allows you to deploy your application on any platform and make sure that your customers are receiving the best experience possible.

Covisint

Covisint is a company that is owned by Compuware. They help connect an organization by using the cloud. It has been in the market for 10 years and has been rated one of the top cloud IAM services. It is powerful in identity management and attestation, provides consumer identity management, and has extensive strong authentication capabilities. These services give the clients the ability to fully customize how they utilize the cloud, even allowing the client to create their own API's for it easily. This lets them create their own administrative tools and setup custom identity access, all while helping keep costs down for the client compared to completely hosting their own.

Professional IT Services

If clients ever need any professional services, Compuware offers a variety. They offer solutions with mobile software, business intelligence, technology performance, cloud computing, and IT governance. They will help achieve difficult business objectives in order to keep their clients at maximum efficiency and profits. This keeps their clients above the competition and makes Compuware highly desired. They also help with keeping clients up to date on the newest technology. If someone's technologies and processes are old and outdated, they can quickly and effectively push you into the newest processes in order to keep companies ahead of the rest.
